'Key Macro' scripts are templates that are either created by users or created by developers. They are used to format data that is entered in an interface. These macros are generally stored in a database and do not need to be run. Macros are very similar to other databases, such as Oracle, MySQL, and SQL Server. Macros in Access work like variables. You define them, define their scope, and then you define how they can be used. When you do this, macros are able to take input from the user and then perform an operation on the data. A macro in Access is similar to an SQL statement. There are two types of macros that are available in Key Macro: HTML and non-HTML. 'HTML Macros' work just like they do in a browser. This means that they will format data the same way that the web browser would. This has the

advantage of creating consistent formatting across applications. 'Non-HTML Macros' have the ability to perform more complex formatting, such as conditional formatting. Conditional formatting is very similar to VBA functions in Excel. It allows you to put a series of statements that are evaluated when a certain condition is met. Key Macro consists of macro functions and macro variables. You define a macro function, and then you define what each function is used for. 'Macro variables' are used to store values that the macro function uses. When it is time to run the macro, the macro function uses the values stored in the macro variable. Key Macro allows you to create multiple macros and organize them into different sections. This allows you to create multiple macros and organize them into different sections. Key Macro allows you to format data by adding the data to a report. You can change the format for each section, and you can add a new section if you would like to have different sections of data. This data can be as complex as you want it to be. You can define columns and rows, as well as add formatting and functions to your data. HTML Macros You can access HTML

Macros from two places: from within the interface and the Macro List. Macro List: This is where all of your macros are stored. You can add macros to your list by creating a new entry in the list. You can also delete macros from this list. The list is
